Assignment 6: GLMs (Linear Regressios, ANOVA, & t-tests)

Katherine Owens

OVERVIEW

This exercise accompanies the lessons in Environmental Data Analytics on generalized linear models.

Directions

1. Change "Student Name" on line 3 (above) with your name.
2. Work through the steps, **creating code and output** that fulfill each instruction.
3. Be sure to **answer the questions** in this assignment document.
4. When you have completed the assignment, **Knit** the text and code into a single PDF file.
5. After Knitting, submit the completed exercise (PDF file) to the dropbox in Sakai. Add your last name into the file name (e.g., "Fay_A06_GLMs.Rmd") prior to submission.

The completed exercise is due on Monday, February 28 at 7:00 pm.

Set up your session

1. Set up your session. Check your working directory. Load the tidyverse, agricolae and other needed packages. Import the *raw* NTL-LTER raw data file for chemistry/physics (`NTL-LTER_Lake_ChemistryPhysics_Raw.csv`). Set date columns to date objects.

2. Build a ggplot theme and set it as your default theme.

#1

```
setwd("C:/Users/Katherine/Documents/872-Data Analytics/Environmental_Data_Analytics_2022")
getwd()
```

```
## [1] "C:/Users/Katherine/Documents/872-Data Analytics/Environmental_Data_Analytics_2022"
```

```
library(tidyverse)
#install.packages("agricolae")
library(agricolae)
#install.packages(htmltools)
library(htmltools)
library(lubridate)

Lake <- read.csv("./Data/Raw/NTL-LTER_Lake_ChemistryPhysics_Raw.csv",
                 stringsAsFactors = TRUE)

# Set date to date format
Lake$sampledate <- as.Date(Lake$sampledate , format = "%m/%d/%y")
```

#2

```
# Set theme
mytheme <- theme_classic(base_size = 12) +
```

```
  theme(axis.text = element_text(color = "blue"),
        legend.position = "bottom")
theme_set(mytheme)
```

Simple regression

Our first research question is: Does mean lake temperature recorded during July change with depth across all lakes?

3. State the null and alternative hypotheses for this question: > Answer: H0: No the lake temperature does not change with depth across all lakes. Ha: Yes the lake temperature will change (in some way) with depthe across all lakes.
4. Wrangle your NTL-LTER dataset with a pipe function so that the records meet the following criteria:

- Only dates in July.
- Only the columns: `lakename`, `year4`, `daynum`, `depth`, `temperature_C`
- Only complete cases (i.e., remove NAs)

5. Visualize the relationship among the two continuous variables with a scatter plot of temperature by depth. Add a smoothed line showing the linear model, and limit temperature values from 0 to 35 °C. Make this plot look pretty and easy to read.

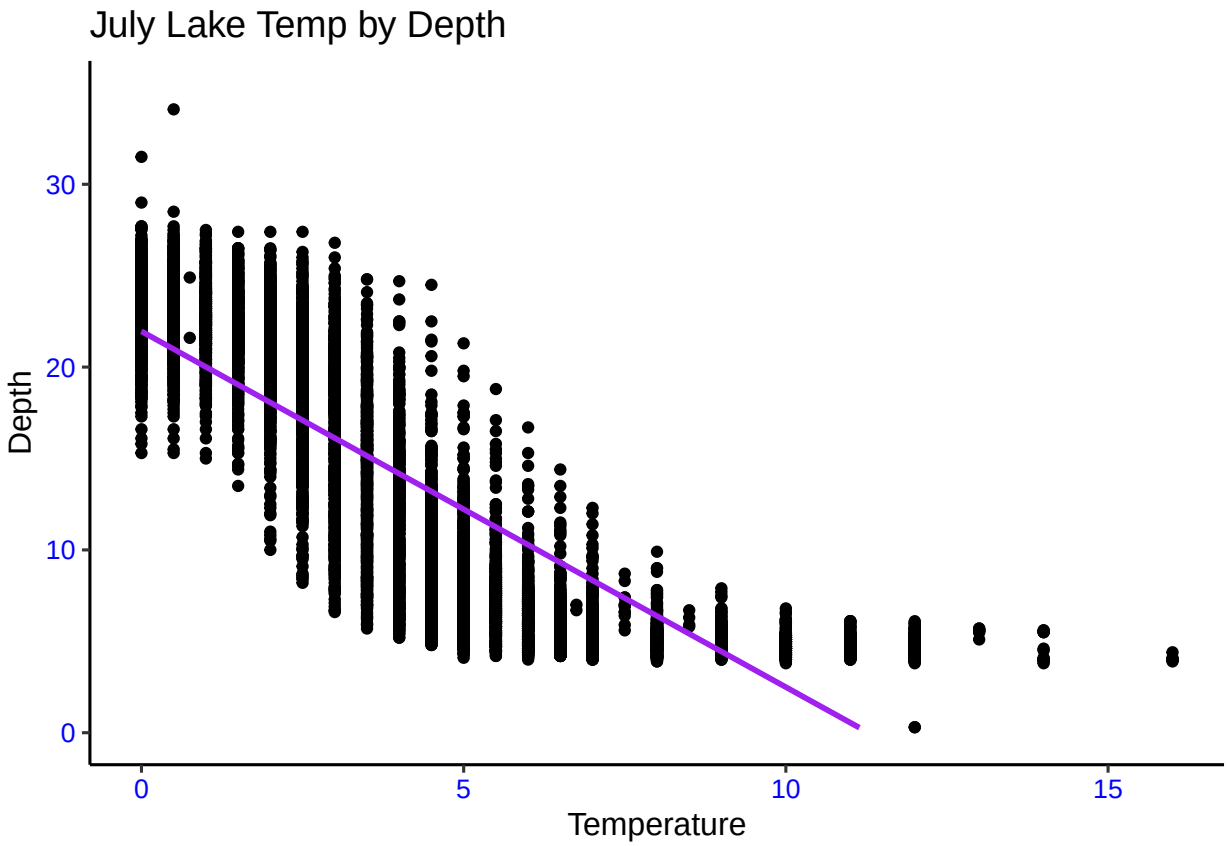
```
#4
JLake <- Lake %>%
  mutate(month = month(sampledate)) %>%
  filter(month == 7) %>%
  select(lakename, year4, daynum, depth, temperature_C)%>%
 na.omit(Lake)

#5
T_by_d <-
  ggplot(JLake, aes(x = depth, y = temperature_C)) +
  ylim(0, 35) + #setting limits
  geom_point() +
  geom_smooth(method = lm, color = "purple") + #adding a trendline
  ggtitle("July Lake Temp by Depth") + # for the main title
  xlab("Temperature") +
  ylab("Depth")

print(T_by_d)
```

```
## `geom_smooth()` using formula 'y ~ x'
```

```
## Warning: Removed 24 rows containing missing values (geom_smooth).
```



6. Interpret the figure. What does it suggest with regards to the response of temperature to depth? Do the distribution of points suggest about anything about the linearity of this trend?

   Answer: Given the distribution of the temperature values, we do not have a linear relationship between x and y in this case.

7. Perform a linear regression to test the relationship and display the results

```
#7
T_by_d.regression <- lm(data = JLake, temperature_C ~ depth)
summary(T_by_d.regression)
```

```
##
## Call:
## lm(formula = temperature_C ~ depth, data = JLake)
##
## Residuals:
##     Min      1Q  Median      3Q     Max

## F-statistic: 2.75e+04 on 1 and 9726 DF,  p-value: < 2.2e-16
```

8. Interpret your model results in words. Include how much of the variability in temperature is explained by changes in depth, the degrees of freedom on which this finding is based, and the statistical significance of the result. Also mention how much temperature is predicted to change for every 1m change in depth.

   Answer: The slope of the temperature by depth plot has a negative value of 1.95 with a y-intercept of 21.96, both of which are not zero providing evidence to reject the null hypothesis.This means that for every 1m change in depth there is a 1.96 degree celcius change with the deeper the water the colder the temperatures. There are 9726 degrees of freedom, 73% of the variability in temperature is explained by changes in depth. Also, because the p-value of the linear regression is less than 0.05 with a value of <2.2e-16 the linear model is statistically significant.

Multiple regression

Let's tackle a similar question from a different approach. Here, we want to explore what might the best set of predictors for lake temperature in July across the monitoring period at the North Temperate Lakes LTER.

9. Run an AIC to determine what set of explanatory variables (year4, daynum, depth) is best suited to predict temperature.

10. Run a multiple regression on the recommended set of variables.

```
#9
JLake_AIC <- lm(data = JLake, temperature_C ~ depth + daynum + year4)
step(JLake_AIC)
```

```
## Start:  AIC=26065.53
## temperature_C ~ depth + daynum + year4
##
##          Df Sum of Sq    RSS   AIC
## <none>                141687 26066
```

```
## - year4   1       101 141788 26070
## - daynum  1      1237 142924 26148
## - depth   1    404475 546161 39189
```

```
##
## Call:
## lm(formula = temperature_C ~ depth + daynum + year4, data = JLake)
##
## Coefficients:
## (Intercept)        depth       daynum        year4
##    -8.57556     -1.94644      0.03978      0.01134
```

```
#10
MultRegrM_JLake <- lm(data = JLake, temperature_C ~ depth + daynum + year4)
summary(MultRegrM_JLake)
```

```
##
## Call:
## lm(formula = temperature_C ~ depth + daynum + year4, data = JLake)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -9.6536 -3.0000  0.0902  2.9658 13.6123
##
## Coefficients:
##              Estimate Std. Error  t value Pr(>|t|)
## (Intercept) -8.575564   8.630715   -0.994  0.32044
## depth       -1.946437   0.011683 -166.611  < 2e-16 ***
## daynum       0.039780   0.004317    9.215  < 2e-16 ***
## year4        0.011345   0.004299    2.639  0.00833 **
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 3.817 on 9724 degrees of freedom
## Multiple R-squared:  0.7412, Adjusted R-squared:  0.7411
## F-statistic:  9283 on 3 and 9724 DF,  p-value: < 2.2e-16
```

11. What is the final set of explanatory variables that the AIC method suggests we use to predict temperature in our multiple regression? How much of the observed variance does this model explain? Is this an improvement over the model using only depth as the explanatory variable?

    Answer: The AIC method resulted in all three variables of year4, daynum, and depth being included in the final set because the showed up on the top without any of them being removed. 74% of the observed variance is explained by this model, which does demonstrate an improvement from only using depth as an explanatory variable because the r-squared value increased from 73% to 74%.

Analysis of Variance

12. Now we want to see whether the different lakes have, on average, different temperatures in the month of July. Run an ANOVA test to complete this analysis. (No need to test assumptions of normality or similar variances.) Create two sets of models: one expressed as an ANOVA models and another expressed as a linear model (as done in our lessons).

```
#12
JLake_anova <- aov(data = JLake, temperature_C ~ lakename)
summary(JLake_anova)
```

```
##               Df Sum Sq Mean Sq F value Pr(>F)
## lakename       8  21642  2705.2      50 <2e-16 ***
## Residuals   9719 525813    54.1
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

```
JLake_anova_lm <- lm(data = JLake, temperature_C ~ lakename)
summary(JLake_anova_lm)
```

```
##
## Call:

```

13. Is there a significant difference in mean temperature among the lakes? Report your findings.

    Answer: If the p-values are greater than 0.05 then no there is not a significant difference, in support of the null (same means). For the aov model , the intercept is 21.96 with a small p-value less than 0.05 meaning there is a significant difference. For the linear model, the intercept is 21.96 with a small p-value less than 0.05 meaning there is a significant difference.

14. Create a graph that depicts temperature by depth, with a separate color for each lake. Add a geom_smooth (method = "lm", se = FALSE) for each lake. Make your points 50 % transparent. Adjust your y axis limits to go from 0 to 35 degrees. Clean up your graph to make it pretty.

```
#14.
T_by_d_lakes <-
  ggplot(JLake, aes(x = depth, y = temperature_C, color = lakename)) +

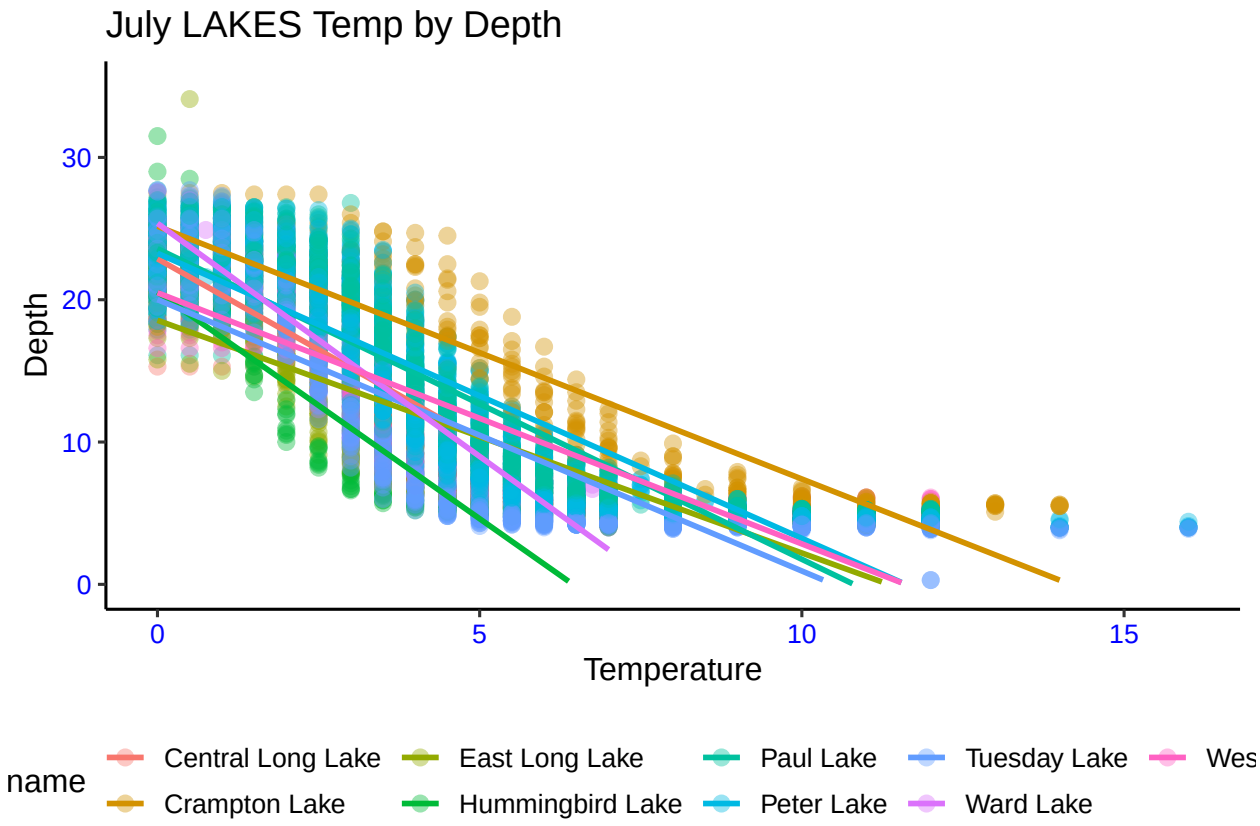
  geom_point(alpha = 0.4, size = 2.5) +
  geom_smooth(method = lm, se = FALSE) + #adding a trendline
```

```
  ggtitle("July LAKES Temp by Depth") + # for the main title
  xlab("Temperature") +
  ylab("Depth") +
  ylim(0, 35)  #setting limits

print(T_by_d_lakes)
```

```
## `geom_smooth()` using formula 'y ~ x'
```

```
## Warning: Removed 73 rows containing missing values (geom_smooth).
```



15. Use the Tukey's HSD test to determine which lakes have different means.

```
#15
TukeyHSD(JLake_anova)
```

```
##   Tukey multiple comparisons of means
##     95% family-wise confidence level
##
## Fit: aov(formula = temperature_C ~ lakename, data = JLake)
##
## $lakename

16.From the findings above, which lakes have the same mean temperature, statistically speaking, as Peter Lake? Does any lake have a mean temperature that is statistically distinct from all the other lakes?

> Answer: The lake that has the same mean temperature as Peter lake is Paul Lake because they are both in the same C group. However it shows that all the group letters for the lakes have some type of overlap with another letter, meaning there is not any lake with a statistically distinct mean. If there were then there would be a group letter that is alone and has no overlap with any of the other letter groups.

17. If we were just looking at Peter Lake and Paul Lake. What's another test we might explore to see whether they have distinct mean temperatures?

    Answer: Paired-sample tests and independent-sample tests are both good options.
